In addition to what follows, when has a socialistic society prospered? The Soviet Union went broke under this premise, and China succeeds only by taking advantage of the many free markets that are out there. We have proof socialism doesn't prosper, and I do not want a socialistic internet, either.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

To put it bluntly, the Internet is the great thing it is precisely BECAUSE of the lack of government control. Don't screw it up.

Why would the Government want to own the internet for the People? Leave well enough alone! Why would the Government want to own the internet? Taxation? Restriction and control? Anyone who wants access can get access, just pay for it themselves or go somewhere where there is public access.

I have yet to see a government operated business do well financially. Look at Medicare, Medicaid, TARP, Cash for Clunkers, Fannie Mae, Freddie Mac, and the Stimulus Programs. None of them have been funded properly, oversight is horrible and corruption is rampant.

We do not need nor want, and will oppose, even fight, any government intrusion into the area of internet control. There is no problem in this area, therefore no solution is needed. It is not broken, and any disguised attempt to impose government control will be viewed by millions of Americans like myself as an unjust violation of our inherent, constitutionally guaranteed freedoms.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

You have already taken or are trying to take away our rights to everything. This has got to stop, NOW!!!!

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive and needs to remain so. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

As a citizen of the United States of America, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The proposed take over and federalization of the internet to make it equitable, is non-American. My ability to use the internet and the access to all that I now have access to will change. My options will become limited. Government intervention is not needed and has a history of crippling growth with all its regulations. Also there is no recourse for the people when the government infringes and misuses its regulatory powers but with a private company people can fire them or sue.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet CONTENT RESTRICTIONS, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. No different than telling us what to eat, what temperature to set our heaters at, it is no longer the land of the free.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The government, needs to stay out of our business and stop trying to take away our freedoms and access to services and taxing everything we eat, drink, use, or buy!. I think our internet sites need to be regulated to be made secure and a form of communication we can use freely and without fear of cyper hackers and getting our accounts broke into, things like that. American people need to have many forms of access and sites to choose how they wish to communicate, where it be by cell phone, landline phone, email, internet, twitter,facebook, whatever, We also need to have choice in what TV network we watch and should be able to get a well rounded view of everyone's perspectives, not JUST ONE SIDE, or one Political group.

We are watching Obama and his adimistration and their moves, since he lied about being open and transparent, and having the debate of health care on C span which he has not.

He is trying to sneak in too many things thru the back door and non announced or discussed or without given the public their option to vote for or against it.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

WARNING!!!

REMEMBER THE TOTAL CLEANSING OF ALL CORRUPT POLITICIANS IN 2010!!!! We the People will speak softly with a BIG Vote to get rid of all the TRASH/CORRUPT Politicians!!! In God We Trust!!! Hoorah!!! READ THE BILL AND FOLLOW OUR CONSTITUTION!!!! OBAMA SHOW US YOUR REAL BIRTH CERTIFICATE ON 26 JANUARY 2010 IN FRONT OF THE COURTS!!! TAKE A BIG HINT AFTER THE NOVEMBER ELECTIONS!!! WE ARE ON THE MOVE AND ALL POLITICIANS THAT ARE WITH OBAMA AND VOTING AGAINST AMERICA WILL BE VOTED OUT OF OFFICE!!!

Sincerely a Concerned Vet and American Patriot,

The government has grown far too large and has way too many regulations as it is. It is time for the government to realize that the people of this great nation are "fed up with the fed". We do not want this to go forward. Private investment and Capitalism must be the highest priority for this Country to survive. TAKE THIS AS A FIRM "NO" TO YOUR PROPOSAL!!!!!!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Let free enterprise rule. I do not support any more government intrusion into our lives. The government has a proven track record of inefficiency, waste, and fraud. Why would anyone want to give the government more power is a mystery to me. The internet needs to remain strong. The only way to do that it to let the innovation, and private enterprise competition continue to create a better, faster, cheaper internet.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The Internet is a free system that works and will continue to work unless some government entity begins to interfere with private enterprise. Why fix something this is not broken with some sort of governmental oversight that is not needed. The purpose of government is to provide services for the taxpayers that they cannot readily supply for themselves. This has been working for some time with governmental interference and there is no need for government to step in and interfere.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

I find it very disturbing that government control of the internet is under consideration by the FCC. The language that is being used to frame this ruling, such as "net neutrality" and "open internet" is very deceiving. Matters of this importance should rightfully be debated by our elected members of Congress, not decided by federal regulators. This matter certainly has not been adequately publicized to give Americans the opportunity to respond to this back-door entrance of yet more government control. This is an outrage. I am strongly opposed.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be openly debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

This subject is more than "opinion" as to who manages the internet, as it is at the core of free speech, and the government should stay out. Government interference is already extremely visible in the control of the airwaves. The government's job is to keep them free, not to restrict them. People and markets would control them if government stopped interfering. Take the freedom to buy our own cars--this has made the whole industry, from production to possession a highly prosperous and pleasant freedom. Government interference by telling us how, what, and when we can produce or possess is negative.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unconstitutionally restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. This tells me that I am under a regime, one that is not Constitutional nor is friendly to individual freedom.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Please stop this takeover of individual freedom!

Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. It is an outrage to even think that such a "power grab" is actually being considered, and I for one am adamantly opposed to it. So opposed, in fact, that I am prepared to work tirelessly for votes against the Democratic incumbents in Congress and the White House who treat us with such disdain. And this comes from one (me) who has voted mostly Democratic throughout my entire life. No more, though. I, my wife, her mother and my parents no longer recognize a once great party that truly cared for its constituency, but which now pursues some un-American brazen agenda designed to turn this nation into another socialist state.

As an American for FREEDOM, PROSPERITY and the PURSUIT OF HAPINESS, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is the last bastion of freedom in the United States. It is the only social, economic tool at our disposal free from endless regulatory requirements and prying eyes of bureaucrats who success is measured by the level of pain, grief and monetary discomfort inflicted upon private entrepreneurs.

The internet also allows Americans to showcase their God given talents without bias or discrimination. You do not know whether the user is black, white, male, female, handicapped, gay, straight, transsexual or sitting naked in front of the computer screen.

The internet is also highly competitive. If you don't believe me, just ask AOL. There is no need to "regulate" on the guise of competition or consumer protection.

The Internet is free from government subsidy and control that inevitably gives way to the political winds and whims that favor one social/economic classification over another. Indeed, if the "public utility" model is the desired outcome of the internet, then I can only conclude that the proponents of regulation harbor seditious desires to control the freedom, wealth, and even the vary thoughts of the American public.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that at the least, should be debated in Congress by legitimately elected legislatures. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing the alarm bell for so long (since 2002) that the meer lack of their predictions coming to fruition should tell us that their claims are unfounded.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations to control this great engine of innovation, growth, and expression that the Internet has become.

If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Respectfully,

Catherine Barrett

If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

There is no credible argument for taking what has been built, funded, and maintained freely and efficiently by the marketplace and turning it over to heavy-handed, inefficient, politically motivated government regulation. This will be rightly seen as another intrusion by big government (you) into the lives of ordinary citizens. There is no public outcry for this move, and rightly so. Government intervention into the free market is contrary to the best interests of the citizens of the United States.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Is there nothing that you will not try to control and regulate and in the end, destroy? There is nothing wrong with the internet as it functions now. Look at what it has become for goodness sake! What a gift to the world!! Leave freedom of speech and communication alone and leave Americans alone. We can think for ourselves believe it or not. Besides, is our economy not damaged enough as it is? You want to risk the loss of more successful private businesses? But that's your agenda isn't it? Soon there will be no private sector if you can have your strident, dictatorial and arrogant way. The will and well being of the people be damned.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

In short it my firm belief that the Federal government has absolutely no good reason to, in effect, confiscate a private business enterprise. To proceed with the subject plan to ipso facto remake the internet into a "public utility" is a very suspect and dishonest, unconstitutional, socialistic and unAmerican misuse of federal authority. This nation is great because of our system of free enterprise. Government interference depresses that system and is totally inept in every attempt ever made to get any job done which business can do better.

The American people are sick and tired of these ill-advised attempts at increasing control of our lives. When our Freedom and Liberty are at stake we shall not accept such brazened attempts to limit what government cannot give us: our Freedom and Liberty.

As an Americans for Prosperity activist and a citizen deeply interested in electronic media and matters of free speech, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is - and should remain - highly competitive. Traditional telephone and cable companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. This capitalist system serves as a rudimentary check against marketplace corruption in Internet Service Providers (ISP). If a private company such as one of the aforementioned ISPs blocked or censored Internet traffic maliciously it would eventually lose all its customers, who would flock to another ISP. If government exercised control over the Internet, there would be no place for weary consumers to turn for relief.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create dramatic litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring even more government control and politicization along with government ownership. Such politicization would definitely pose a risk to online freedom of speech in the near future as a result of this "public utility model". Regardless, such a "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be heavily debated in Congress, the legitimately elected legislative branch of government. The Commission should not take it upon itself to set such dramatic and potentially devastating regulatory changes into motion that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. These restrictions pose the greatest threat to our First Amendment rights online.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years - beginning with the November 19, 2002 letter to the Commission from the self-proclaimed "Coalition of Broadband Users and Innovators" - that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and free expression that the lightly regulated, highly competitive Internet has become. To impose such regulations would be to destroy the Internet as we know it and transform it into another government-sanctioned, heavily taxed (and therefore higher priced) machine where the consumers are oppressed and freedom of speech is no longer tolerated.

Please, do whatever is necessary to keep government hands off of the Internet! The survival of the growing online culture depends upon a free, open and competitive Internet market.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Thank you,

John Beane

What you are talking about is neither an open internet or net neutrality. What we have now is an open and neutral internet. The Federal government and the FCC have vitually no place in regulating the internet. Almost any regulation would be contrary the my rights of free speech and freedom of press.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I am sure that I will not be the first to raise the concern that governmental regulation on any level restricts the most basic of our American rights—freedom of choice.

With any free nation comes individual responsibility. While it is true that some individuals will make bad choices, and others will make good ones, it is also true that all actions have consequences, and all who make choices will either suffer the results of bad choices, or be rewarded for good ones. Let's not forget that we all have the capacity to learn, and those who make bad choices will learn from their mistakes. Some of the most caring people, some of the most well-rounded people, some of the most ambitious people in the world had to learn from their bad choices. Please, let individuals make their choice in regards to what they see, hear, and do, with respect to the Internet. Do not impose the morals of one person or group of persons by regulating in any way, shape or form, what by rights is an individual issue.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

And lastly let me add that in the past 10-15 years the internet has brought untold benefits to Americans and people in many other countries. It allows us to communicate ideas, buy and sell products and enjoy music and video. If we do not like what our providers offer with price or features we can drop them and find another provider. The internet is already "open" and the heavy hand of government will not make it more so, only less.

Furthermore, I am incensed with the deceptive language used in the naming of bigger-government, freedom-limiting legislation such as these offensive proposed “Open Internet” rules. The internet is already open. It is obvious that the rules are meant to restrict it.

As always, government intervention into the private sector is a very bad idea. This is nothing more than a power grab. The government has no need, and quite possibly no authority, to interfere with the workings of the market place.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Please stop government interference in our daily lives. We've already lost too many freedoms.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

A transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Leave our internet alone ! We need to retain this avenue of unfettered public free speech, especially in this age of monopolistic networks controlling much of the print media and TV stations.

If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

In conclusion... You cannot get more "Open Internet" than keeping the Government out of it!... The Internet is already OPEN and being run by the Free Enterprise Market Place... It cannot get much freer than that...

Keep in mind every time Government has gotten involved we end up losing our Freedoms and what was once "FREE" now ends up costing Americans an arm and a leg.

Please do not be fooled again by these people... Keep America Free. Keep Government from destroying Free Enterprise... Let the Market Place be self regulating... That is what America is all about...

Like so many of my fellow Americans-for-Prosperty colleagues, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised (i.e., monopolized) control over the Internet, there would be no other place to turn for free/unfettered access to the Internet.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in the sunshine in Congress, the legitimately elected legislative branch of government. It would be illegal and unconstitutional for the Commission to set into motion its own regulatory changes to force this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Heavy-handed regulation could destroy private investment in the Internet, in turn forcing taxpayers to spend hundreds of billions of dollars to keep the Internet functioning, bringing government ownership and control.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Since 1998 I have been actively using the internet and seen how competition has driven the market to provide better and faster service. I have seen regions with few options grow to several options. My mother has a farm and I was comparing companies top provide high speed service for her and had 5 options to choose from within seconds of searching. Government control of the internet providers will slow and over time destroy growth with bureaucracy.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52: (he concept of an "open internet" can ONLY be maintained if it is left unencumbered by regulation. The moment government attempts to regulate it free and already-open access and content in ANY manner, it will no longer be any of those thing. History has shown time and again the government regulation only has a propensity for destroying, not improving. Therefore I, as a citizen of these United States, say "Nay" with regard to the proposed regulation.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. We are not Communist China. Stay out of our sources of information and communications. Every time a government (any government) does something to make things more fair or safer, they take control and make things less fair and less safe. Just stop trying to improve things and trust the people who use and pay for the services to make things better. As well as making them the way they want!

Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

AFP's concerns are well-founded. And in your own language your reasons for wanting to impose "net neutrality" or "open internet" seem justifiable. There are problems on the internet. You would like to alter web traffic to adhere to more controllable and "socially responsible" guidelines.

Here is the problem with your plan. Placing control into the hands of government agencies like your own is the worst scenario. You fear the "wild west", an uncontrolled and dangerous expanse. I know from reading my history, though, that the "wild west" is vastly preferable to your "civilized east." If the net remains free, there will be those that will take advantage. They will spread foul ideas, take too much power for personal profit, and use bandwidth for seemingly unnecessary things. There will be some bad stuff.

In your hands, however, the net will become a hollow shell of what it currently is or could be if left alone. It doesn't matter if your ideas are noble, or if your current plan truly is good. Either you or your successors would use your new-found power ruin this vastly powerful method of communication. You think the madness of the marketplace is inefficient? Government bureaucracies have proven themselves to be far worse.

What concerns me most, however, is how untrustworthy you are when it comes to abiding by the US Constitution and the principles of Liberty. I know that you or your successors would attempt to control the content of the internet. You would quash free speech in the name of some "greater good" when the political wind blows in your favor.

For this reason alone I have made up my mind. Your progress is not progress at all. Please get your hands away from the net.

In addition to the statement below, I want to reinforce the thought that the Internet, as it is now maintained and operated, does not need any government oversight or control. It is performing its function very well, since the inception, as a private enterprise. The laws of supply and demand must be utilized to insure this extremely important communications function continues to serve all who desire to gain benefit from its service.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Companies should have the right to restrict traffic that is overwhelming their networks at their best judgment. That way small users will be able to have their messages go through as reward for not being data hogs.

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Private enterprise built the internet and the only reason government wants control is because it fears an unregulated internet. For that reason alone I oppose any and all governmental involvement, intrusion or control of the internet. It works fine without and further "fixing".

Government out of private enterprise. Government out of the internet.

Government's mandate is national defense, not social engineering. Stick with your mandate and leave private enterprise alone.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become. I THINK BIG GOVERNMENT IS STICKING ITS NOSE INTO TOO MUCH OF OUR PERSONAL RIGHTS. DON'T KEEP SENDING ME LETTERS OR REQUESTS FOR MONEY ETC. IT WILL JUST BE A WASTE OF TIME AND MONEY.

I am submitting the following comments regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised un-Constitutional censorship over the Internet, there would be no alternative.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive, unjustified by any legitimate concerns, and will obstruct perfectly reasonable and economically efficient business models. This rulemaking will also impose unreasonable business uncertainty and create substantial increased litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the real ultimate goal of many proponents of such regulation.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been falsely ringing alarm bells now for many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”). Their claims should therefore be heavily discounted. In the absence of concrete evidence of a substantial pattern or occurrence of discriminatory or anti-competitive behavior, there is simply no Constitutional justification for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

In view of the clear prospects for a substantial shift in Congressional power following the mid-term election this Fall, the FCC would be wise to refrain from overplaying its hand in these matters.

Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

SICK BASTARDS - This is such a blatant attempt to gain control over free thought and exchanges of ideas. Un-American and an open door for abuse. NO! There is nothing Free OR American by trying to overload an incompetent Government in so many ways as we are seeing right now. Stalin and Mao would be proud. Castro and Chavez full of envy. NO!

The internet is doing just fine without the FCC, so just stay out of the way. This is the last bastion of free enterprise left in America and unlike the government, it works quite well. There is no need for the government to get involved and screw it up. The following is a prepared statement, which I totally support.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

As a working engineer in our National Defense industry, and as an individual who depends heavily upon the internet, I wish to make the following comments to GN Docket No. 09-191, WC Docket No. 07-52:

There is not one, single compelling reason for the government of the US to impose itself upon a system that works well, and serves public, private and business interests admirably, the financial self interest of some vocal advocates of regulation notwithstanding.

As a young man working in the communications industry, I was made aware of the acronym PICON; Public Interest, Convenience, Or Necessity. This was the guiding principle embraced by the FCC.

Increased regulation is not in the public interest, it certainly militates against convenience and is devoid of necessity. I wish to go on record as vehemently opposing any such regulatory action as is contemplated in the above captioned actions.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. As in all private/business operations, if a private company blocks or censors internet traffic it will lose customers. However, if government has control over the Internet, the consumer is lost, without recourse.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that become increasingly economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investment in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or, probably much worse, be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission has no Constitutionally granted authority (I read it frequently - no, it's no there!), and should not, on its own, set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims must be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that will have the effect of slowing down the great engine of innovation, destroying job growth, and expression that the lightly regulated, competitive Internet has become.

If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an American who loves LIBERTY as envisioned by our Constitution, I am against government interference with the internet.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no legitimate (i.e., no non-political) rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become. Aside from empowering government (political objective), most government "fairness" activity of late has done more to limit FREEDOM than protect it. Consequently, I oppose any new government regulation of the internet.

To whom it may concern, Keep your grubby lunchhooks off the internet! Are you kidding me? This proposal (GN Docket No, 09-191, WC Docket No. 07-52) is just another power grab by the wanna be socialists currently in power. I will do everything in my power in 2010 and 2012 to make sure those responsible for this proposal and/or other similar legislation get voted (read FIRED) right out of there jobs! As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The arguments on both sides of this issue are well known by the FCC and the media. I know that my comments reflect thousands Americans just like me, and we do not want government or any other entity to have the power of intervention in any of the media to filter or control any aspect of it. Plainly speaking, it is a competitive environment that will govern and control itself. Like television, news, radio and other media, consumers will stop trading with those they find offensive, unprofitable or otherwise unwanted.

Families have the power to control the exposure of themselves and their children. Private entities can and already are doing the same.

The question of go or no-go forward with intervention is simple contrary to everything the U.S. Constitution is all about. Do not forget this truth.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is not run by coercion. It is run by consensus over the TCP/IP suite and by voluntary fees. The call by the Orwellian group "Open Internet" for those standards to be placed entirely in the hands of the Government is a self-parodic travesty: as if a group called "Open Books" insisted that all printing presses be owned by the government and that all books be marketed the same, printed on the same size paper, &c.

I am very curious, though: how will the FCC, La Pelosi and the One We Have Been Waiting For pry the standards for HTTP/HTML/XML out of the hands of the World Wide Web Consortium (W3C)? The European non-profit will not take kindly to an American takeover.

If the FCC wants to do something useful, break up state-wide monopolies to the township level, and let them run co-ops or contract to telecoms/cable cos. to provide the vast majority of their citizens with net.access.

Susan Crawford and Robert McChesney want to turn the US into Communist China, with our own Great Firewall. No, thank you.

Yours,

Peter Buxton

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

STOP THIS MADNESS NOW. WE ARE THE USA, NOT RUSSIA, NOT CHINA FOR GODS SAKE!!!!!!!!!! YOU ARE ALL PITIFULL WEAK PEOPLE WHO FEAR FREE SPEACH.

There is too much government regulation and control now that does not come from the people, but some government agency. FCC regulation of the internet is another such control that is not needed or wanted. If the FCC were to pass these regulations, who is going to oversee the FCC. If internet regulation is needed, it should come from our Congress and not from an agency.

As an American, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

I think the government should stay out of the internet business. All great discoveries have come from the private sector and not government. The only thing the government has proven it can do well is to spend money and muck things up. There is a need for government in areas such as defense, security, intrastate policing and such but the internet is not one of them. The government should not have the power to step into the private sector and regulate anything they want at anytime.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

A transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The FCC should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

I strongly oppose any government controls that would restrict freedom of decent speech on the internet, or access to the internet by the general public.

As an Americans for Prosperity activist, I adamantly oppose the proposed FCC regulations relating to the internet in GN Docket No. 09-191, WC Docket No. 07-52.

The following are a few of my reasons.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Respectfully,

Further I believe this is a direct violation of my right to freedom of speech and association protected under the US Constitution. The internet started as a means of communication for information on research and subsequently morphed into the contemporary means of gathering and communication information and in many respects has assumed the role of a free press (an other constitutionally protected right). At no time in history have such rights coexisted with a central government where the central government had the ability to exercise regulatory or confiscatory control.

This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

"Net neutrality" is just one more play by the government to grab power and control our lives. We, the People, will not stand for it.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

"Open Internet" or "net neutrality" sounds simple - force phone and cable companies to treat every bit of information the same way - until you realize that modern networks are incredibly complex, with millions of lines of code in every router. Making sure services like VoIP, video conferencing, and telemedicine (not to mention the next great thing that hasn't been invented yet) get priority may be necessary to make the Internet work, but the government is considering regulations that will make it illegal to prioritize traffic.

These networks cost billions of dollars to build and maintain, and if there is uncertainty about getting a good return on that investment, private investment will dry up.

The internet should be left alone. No government involvement is needed.

Sincerely,

Donald R. Cash

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

Please don't interfere in this most vibrant and free aspect of Human Culture. As in the case of the most recent example of Government intervention in the economic life of the American People that has resulted in a housing bubble and resulting debt crisis that still threatens the entirety of the World's financial system, the Law of Unintended consequences will once again reveal the stupidity of those that forsake human freedom and the Market Place of Ideas for some elite driven concept of human and societal perfectibility. Please leave the Internet alone. Please let market forces and competition continue to work out the supply and demand issues involving bandwidth without the imposition of rules from this body.

Also, I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. I support a truly open, competitive, privately owned and controlled network. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn. Let Government create its own network to COMPETE with privately owned networks. Competition is good. But DON'T INSERT GOVERNMENT REGULATIONS to "MUCK UP" the successful Privately owned networks.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

To maintain free and open access to the internet the FCC should exercise extreme regulatory restraint. Free markets and private ownership have built, managed and maintained the internet for over two decades responsibly and without exclusionary practices. Do not stifle the growth of this industry by burdening a growing, thriving economic engine with regulations born from unfounded fear of denial of service.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.
DO NOT GO THERE !!!

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

If a private company blocked or censored Internet traffic it would lose its customers and legal redress would be possible. However, if government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices creates uncertainty and litigation risks. Such restrictions would cause investors and existing networks to hesitate on or cancel plans to expand.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, inevitably politicizing the process.

Look, Congress is already doing enough damage. You really don't have to join in the destruction. The Commission should not on its own set into motion these destructive changes, even if pressured by Congress.

The so-called “net neutrality” is just more vaporware.

Please don't further slow down the great engine of innovation, growth, and expression that the current, competitive Internet has become.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

I ALSO PERSONALLY OPPOSE HANDING THE INTERNET TO THE MAJOR COMPANIES SO THAT THEY CAN CHARGE FOR EVERY LITTLE THING! THEY DIDN'T INVENT, IT THEY SHOULDN'T CONTROL IT, EITHER. i WANT THE GOVERNMENT AND BIG BUSINESS TO LEAVE THE INTERNET THE FLACK ALONE. IT BELONGS TO EVERYONE; NOT TO AT&T, NOT TO COMCAST, NOT TO ANY COMPANY SO THAT THEY CAN CONTROL THE FLOW OF INFORMATION AND DENY FILE SHARING. STAY THE FLACK OUT OF THE INTERNET. LEAVE IT ALONE.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I am against any so-called net-neutrality. Please do not go any further with this crippling regulation. It will destroy the power of the internet and strangle the effectiveness of our systems. It is simply a way for far-leftists to have control over the rights of a communication system that is, so far, free. Keep it that way.....

RE:GN Docket No, 09-191, WC Docket No. 07-52:

I am opposed to the contemplated "open internet" or "net neutrality". In it's current unregulated state, the internet is unique as a free and unregulated form of communication allowing unbridled competition and innovation. The proposals contained in the above referenced item will stifle competition and innovation mirroring the decline in our economy due to government interference.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

Well there goes high quality Video Conferencing over the open and "free" internet. I work in an environment where we use lots of Video Conferencing. While it works great on our privately owned and prioritized network it doesn't work good on the open internet. Two years ago we found some serious quality issues over our own WAN. After many meetings and discussions it was discovered that the Video Conferencing (VC) traffic was being treated with the same priority as the reset of the traffic. If you go a head with Net Neutrality you will limit the growth of VC over the public internet. Instead of companies being able to purchase prioritized traffic to make their VC systems work flawlessly on the public internet they will be forced to purchase dedicated private lines. So while you say this is to free up the system your actually putting a hold on growth in the area of VC.

Prioritized traffic is critical to VC in order to preserve quality. When you read an email or surf the net the order in which you receive packets is irrelevant. If the last part of your email comes in first and the first comes in last you don't care or even notice. Do you care if the bottom of your web pages comes in first and then the top part...no? Priority for surfing the network and for email isn't important. Now do the same thing for VC. Let the 3rd second come in first and then have the 1st second come in followed by the 5th and then the 2nd second would create an unviewable picture. Getting the information to come in in the proper sequence can only be achieved by giving that traffic a higher priority than the reset of the traffic.

The use of Video Conferencing will allow more people to drive and fly less which will allow the planet to become greener. So it's not only in the best interest of Video Conferencing to have prioritized traffic it's also in the best interest of a greener planet.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

THIS IS A FREEDOM OF SPEECH ISSUE, PLAIN AND SIMPLE. AND AS SUCH, ACCORDING TO THE CONSTITUTION, YOU DO NOT HAVE THE RIGHT TO SILENCE MY VOICE!

Virtually everything you touch is less effective, less profitable, less efficient and less equitable than it is prior to your involvement. Leave it alone. I do not want you to advance your agenda, whatever it may be, at my expense any longer. I make my living in large part due to the internet and I am sure you will adversely effect my ability to provide for my family and in turn pay your bloated salaries if you get involved. Please find something else to ruin that will not have such a devastating impact on society.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

Sometimes I wonder if I have moved to another country? We are the United States of America, the land of the free. Why is the government trying to have power over everything the citizens of our great Country try to do. The illegal aliens have more freedom and more benefits than the tax-paying Americans of our Nation. May God Help Us. Oh, yes that is not politically correct anymore. No wonder our Country is in such dire straights. God is great and needs to be put back in our Country as the Divine ruler over all!!

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The government does not make things run better. All it does is add cost and take away our freedom. Why would anyone support that? The only reason I can think of is those who do not care about how things run but do care about control, control at all cost.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

My email is personal, just like putting a letter in an envelope and sealing it and mailing it vial the U. S. Postal service. I expect the internet to be the same way. It is no business of the U. S. government what email I send unless it is pornographic. Leave the internet alone and keep the government out of my business.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

The Internet does not belong to the government -- it belongs to the private investors who built it and the millions of users who contribute to it.

The federal government has no enumerated power to intervene in uses of the internet beyond violation of criminal statutes. Though the internet was beyond a dream at the founding of our country, comparisons can be made. Would the authors of the Constitution or our early leaders granted the Federal government to "regulate" bulletin boards? The content of privately published books? Of course not!

At this time, the internet remains one of a scarce few forums which is truly open to free speech, which is itself a right enumerated to the people. The "Open Internet" moniker is itself an insult to the citizenry this would be imposed upon.

A federal regulatory power to "police" the internet is a true affront to the rights of the individuals who built it and who use it every day, and for this basic reason, I am wholly against new regulatory authority over it. Most disturbingly, that it is being sought as an unchecked executive branch power.

Most Sincerely,
Alice Cormaci

The internet has grown up as a wonderfully free media. We do not need additional federal regulation and bureaucracy. Despite the fact that the proposals are touted as "open internet" - federal regulators do two things: regulate and grow their bureaucracies.

If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This cause the cost to maintain the system to rise and be passed on to the consumer making harder for low income families to pay for it without government help. I pay enough taxes and do not need to pay for others to use the internet. Also this will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Government has no constitutional duty or authority to regulate the internet under the Commerce Clause as to do so would cause a chilling effect on the open exchange of citizens who have the right to freedom of speech, freedom of expression and freedom of electronic assembly. Butt out!

Additionally, it is only Marxist who want this foolishness to happen. There is really no reason for it except to stop the free flow of information and a pure bigotry of the Leftist in control of this country right now. It is those who hate true Liberty that are behind this. The enemies of Liberty must be stopped. They will claim “net neutrality” is something to make things equal, but that is a lie. Do not be fooled by the deceivers, the enemies of Liberty.

The enemies of Liberty do not want this to go through an open debate in Congress because they know the public will have a lot of input against their control schemes.

The simple fact is the internet works now. There are no complaints and we do not want to be monitored by the State, nor have the State in control of the very means of communication I am sending this objection. I work in the IT field and I know for a fact government will only make things worse in this area. You need specifics, let me know!

This Administration and its "operatives" are becoming increasingly arrogant in what they think they have a right to do. We, the voters and citizens, elect Congress to represent us. We do not elect members of any Commission. I have no objection to Commissions or Czars, or whatever you like to call them, provided they act as ADVISORS, and do not have any authority to make changes to the laws of this Country. That responsibility lies with the LEGISLATURE and you cannot off-load that responsibility to any other. You and you alone should debate and formulate laws and changes to those laws as our representatives. Any other action is an abdication of your responsibilities, and is unconstitutional. Do not forget that you took an oath of office to uphold the Constitution.

We are tired of every aspect of government attempting to take over and control our lives. Opposing excessive taxation and government control is exactly how this country came to fruition and existence. The government entities are no longer representing the people they are attempting to dictate and rule the people. No we are not stupid and we will oppose those who continue to take away our freedoms. We have military that are currently fighting for freedoms in foreign countries. The citizens of this United States, who are not in the military, will continue to fight for our freedoms here at home.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I also feel that the current administration is going above and beyond those powers granted to the Federal Government via the U.S. Constitution. No where in the U.S. Constitution is the Federal Government given the power to ingratiate itself into a market as a competitor in the free enterprise arena. By doing so, our tax dollars will be spent to put thousands of people out of work and cause an already fragile economy to implode in on itself.

The BIG federal government needs to go back to the original intended size and steer clear of any competitive arenas.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Our internet has had an extremely explosive period of growth since it's genesis, and that is precisely because the government was NOT involved! The government has nothing to offer in the future growth and success of the internet but assured failure ... for the people. Government interference into the operation and governance of our internet is not desired and is positively not wanted!

Keep the governments' hands off our free internet. Otherwise it will not be free for long, and will be available only to whomever the government finds "adaptable" to their terms. Have I made it clear that I do not desire government interference on or in our internet?

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

This is nothing more than an attempt to further control our lives - what material can be disseminated, what we can read/learn, what we can share. The government is seeking to allow only their own point of view as they are already doing in the major media. Now they want to control the information flow on the internet. This is nothing more than a totalitarian move as was used by Hitler and Chavez. Have we come to the horrors of that? This has nothing to do with fairness and will result in totally lopsided information from the Far Left and Socialists. This cannot be allowed. We are not Venezuela, Cuba, China, or North Korea and MUST NOT let this administration have ANY power or means that can turn America into anything like these horrendous governments.

As an Americans for Prosperity activist, and an intense supporter and believer in capitalism, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win both commercial and residential customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. Currently, if a private company blocked or censored Internet traffic maliciously it would lose its customers as they would most certainly move to a competitor they felt better suited their internet needs. If government exercised control over the Internet, there would be no place to turn as it would no longer be a truly free, open and competitive market responsive to users needs as a whole.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably, and irrevocably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. Competition is what drives this country and requires companies to be more efficient. This is not a matter of debate, but fact. Why would anyone impose regulations to make it more difficult on companies? The internet has grown leaps and bounds over it's life time precisely because the government was not involved. To ignore that fact means you are buying into the hysteria being shouted out by committed socialists trying to have more Government control. Which would be fine if the government was efficient, trustworthy, and infallible. But as it is not any of these 3 things we must prevent it from controlling any of the internet

I love America for the capitalist, free-enterprise economic system it offers all citizens. I vehemently oppose the very concept of the left and Obama's agenda to "fundamentally change America". This is truly anti-American. Our constitutional framers would shudder to hear this "net neutrality" assault to our freedom of speech and assembly through government controls.

Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity member, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. This administration is trying to strangle Americans and the freedom guaranteed under The Constitution of The United States and must be stopped. There are three branches of government but it appears the current administration wants ONE. The FCC is not authorized and should not be authorized to interfere with internet access.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive and is a solid example of free market principles. Private companies and software which block specified Internet traffic are available for those concerned about content.

The FCC is not the appropriate place in determining if and what government control should be exercised over the Internet. The internet is not a public utility nor should it become one. As far as I can tell doing so would be extremely questionable when weighed against the constitution. The Commission should not on its own set into motion regulatory changes that will force us down this path. This type of regulation should only come through branches of the government which are appropriately accountable to the citizens such as the congress or senate, not through unelected government employees.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations on the internet.

Sincerely,
Chester Davis

I support Net Neutrality and hope the FCC passes a strong rule that keeps control over the Internet in the hands of users and not ISPs.

Net Neutrality is a rule that conservatives should embrace. It protects our fundamental right to control our media experience without interference by gatekeepers. Such user-powered control is a bedrock principal of the conservative movement.

Organizations like Americans for Prosperity have betrayed their conservative roots in favor of a paycheck from special corporate interests to lobby against Net Neutrality.

The FCC should act in favor of all Internet users, regardless of their politics, and protect Net Neutrality.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The free expression of ideas over the Internet is one of the remaining avenues that allows individuals a chance to communicate with others about their ideas, hopes, and dreams. A free society needs this option. What we don't need is more governmental restriction on our freedom.

Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that would legally have to be debated in Congress, the legitimately elected, yet not very bright, legislative branch of government. The Commission should never on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be completely ignored. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for attempting to impose new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become. In short, stay out of the Internet, you have caused enough trouble already.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

The internet has become a powerful communications and economic force because it has been free from government interference. To ensure that the power and promise of the internet continues, we need to protect it as both a free marketplace of commerce and of ideas. UNLESS there are covert reasons for the gov't's involvement with the Internet, this idea should be trashed. Leave well-enough alone. Thanks you.

Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I do not believe that the government should have any controls over the internet. As parents we can control it ourselves for our children. This is not IRAN and I don't care what you call it, no US government should get involved or try to control the internet.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers.

The fact is that ISP's need the flexibility to prioritize traffic because, frankly, not all traffic is created equal. Having to reserve bandwidth for, say, an individual's personal site covering 20 year old footwear to the detriment of sites more in demand helps no one (except maybe the footwear site owner) and inhibits commerce.

The market will punish ISP's that aren't fair to their subscribers. This so called "net neutrality" policing by the FCC is not needed and would serve only to create additional costs with zero benefit.

Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

I depend on the internet business model to supplement my retirement income, if the net becomes another government monopoly my business will fail, as I do not have the "deep pockets" that all public utilities have. I believe I will be regulated out of business. DO NOT PASS THIS BILL, IT STINKS OF CORRUPTION AND MORE GOVERNMENT BAILOUTS.....

DO NOT PASS THIS LEGISLATION!!!/John Douglas

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

We are supposed to be a free country not a dictatorship.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

We do NOT agree with the open Internet policies. This seems to be a ploy to allow the government to become involved in its regulation. This seems to set the stage for government to be able to control the content and use of the Internet. It seems a small step to shut down communication and information from sources not approved by the people in charge.

Such actions should be discussed in the open by Congress, not put into force under hard to understand rules by a regulatory agency.

Please do not continue on this course of action.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

For the life of me, I can't figure out why anyone thinks the Internet needs to be regulated. For the first time in a very long time, "we the people" have a communications medium that is not controlled by special interests. For the first time in a very long time, "we the people" have a way to help preserve our 1st amendment rights to speak and to peaceably assemble.

Keep the government out of the internet. #1 - where is the Constitutional authority for the FCC to make up laws. I understand that Congress has been ceding its authority to the Executive Branch for a long time, but this still does not make it Constitutional. #2 - preserving the internet requires no regulation. It is functioning just fine as a method for people to communicate.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

Government granted monopolies were the whole reason that cable companies went through massive consolidation and we ended with very little (basically none) until DirecTV came along - and it certainly wasn't government regulation that enable DirecTV to take a huge bite out of cable system revenues.

The free market works, please allow it to. Stay out of the Internet.

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

We don't need any Socialist Government Political hack telling us what to do!

As an American, I am submitting my objection and request regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

This is clearly overstepping the objectives of our Government! Protecting the people is protecting our liberty and freedom!!!

If a private company blocked or censored Internet traffic maliciously it would lose its customers(ie: a "FREE MARKET" value). If government exercised control over the Internet, it would result in First Amendment arguments and likely abuses that would result in many such violations of our constitutionally protected rights. This will impose uncertainty and create significant litigation challenges and expenses.

The Internet is highly competitive currently. The burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that are more likely economically efficient. Government restrictions such as these reduce the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

All that would be yet another un-welcome government intrusion into the private free enterprise market!!! Equal to un-American practices, un-constitutional, non-supporting of individual liberty and the rights protecting our values and principles that do support a free-market, not interfered with or limited by it's elected government.

Are you going to continue to be moving toward a totalitarian - fascist government or self-correct??? Returning to the Republic-Democracy that represents the people of a free-market, pursuant to living with liberty, justice, and happiness!!!

As an intensive user of the internet developed by free people for free people to provide them free access to the total information from around the world. It was NEVER intended nor designed to be controlled or regulated by Government in a free society. Now in a DICTORIAL form of government it may be envisioned since those people do not have FREEDOM. If the US government takes control, regulation or any other action regarding use or content of the internet then we are the same as North Korea, China, Iran. For sure this is not what FREE SOCIETIES DO!

It has been proven that the Internet has allowed for the creation of millions of jobs. Under government regulation, control or administartion this activity will be GREATLY REDUCED.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The federal government regulatory efforts result in debilitating restrictions and limitations in nearly every regulatory area, and the heavily regulated areas of business are struggling to compete with the rest of the world. The Internet has put America on top of the world from a business and economic standpoint. Having the FCC start regulating routing policy is a recipe for destroying America's dominance of the Internet.

The FCC should stick to issues of ethical business practices related to consumers and stay completely out of the technology except in cases where competition is being undermined. Competition and capitalism are what has made America great.

I am a professional Computer Engineer. I have a master's degree in Computer Science from the University of Alabama. I also am a Certified Information Systems Security Professional (CISSP). I make my living working to protect a large enterprise network of nearly 6000 users. I live in the world of the Internet every day.

The FCC needs to stay out of this realm, and the US Federal Government needs to stop with this disgusting socialist anti-American agenda. Our Founding Fathers and framers of the US Constitution would be sickened by the "change" that our current regime is proposing and pressing forward.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

In other words, I want the government to stop intruding into my life and the life of business with your socialist control. We don't need you and your regulations.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Bottom line up front: The internet currently operates efficiently in response to market demand, and allows for individual innovation and creativity in providing products and services that people want and can use. Excessive government regulation will only serve to encumber an already viable system and create more problems than solutions.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

My personal feeling is that this bill would take us toward what they have in PRC -- total gov't control of the internet.

I agree with the form letter remarks below, especially the one about 'no concrete evidence'. To restrict the freedom of the market place, which is really millions of consumers and thousands of competing ISPs, would require an exceptional emergency. There is no such emergency, so this is just another power grab by Congress. Limited gov't and trust in the responsibility of ordinary people is the American tradition. Let us keep it that way!

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The government screws up everything they touch - please stay away from the internet.

China regulates their Internet and the people find ways around it. The tighter the control the more people will resist. We are the greatest nation in history because we have freedom. If we loose freedom then we are no longer a viable state and we will become anothe. Euro-socialist state. We are not China, the current leftist control is driving people back to the center. Each push to the left, leads us farther to the right.

Thanks,

Jim Fetting

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

As one of the early "players" dealing with the internet (I was the systems analyst who designed and installed the integration of our law publishing from editorial input all the way through to book production and data base development including our subscription book shipments AND individual client notification of new material dealing with specific points of law. The first "internet application" was our capturing the opinions of the highest two courts of Michigan as they were typed by a Justice's secretary in her office in the judge's home town, completed by our editorial department in Rochester, NY, handed down as a slip opinion in Lansing, Michigan, set in print at our plant in Webster, NY, assigning headnotes and pagination for future reference, and then publication.) After our system was up and running I went to Washington to help our government "get into the 20th century". The biggest hang-up potential users of our system had was to overcome problems caused by organized labor (our outfit was union free) and the AT&T monopoly (only governments could afford AT&T and only railroads and MAJOR trucking companies had their own telecommunications systems) so I started to work on the US government first. As we published the Lawyers' Edition of the Supreme Court Reports, we needed to get the court opinions in machine readable form.

The Government Printing Office (GPO) charged the Supreme Court \$35/page for printing their slip opinions. I offered to do it for \$3.50/page a 90% discount (and could have done it for nothing as it cost us more than \$3.50 to duplicate their work) but was turned down cold because of the union power at the GPO. Once I started on my selling job I was required to become a registered lobbyist; and with no axe to grind I registered as a representative for the free enterprise system -- the first and only lobbyist that wanted to give the government something rather than get something. The GPO was under the House Administration Committee whose Chairman Wayne Hays ran into trouble first announced in the Washington Post and after resigning his Committee chairmanship and his chairmanship of the Democratic Congressional Campaign Committee where he was "the dispenser of the funds" to the Democrats he finally resigned his seat in the House. The GPO was also under the Senate Rules and Administration Committee chaired by Sen. Howard Cannon of Nevada who failed to get reelected following the trial

and conviction of Roy Williams, President of the Teamsters Union, in which wiretap recordings and direct testimony discussed the very substantial bribe for Senator Cannon's help in defeating the deregulation of the trucking industry.

A lot has been done since 1980 despite the organization efforts of organized labor. If they had their way back in my day you guys wouldn't have this fight today. BUT LOOK AROUND -- THE FREE ENTERPRISE SYSTEM IS UNDER ATTACK AS BAD AS IT HAS EVER BEEN SINCE WE BECAME A COUNTRY.

Stay out of the Internet. Haven't you already managed to screw up social security, medicare, TARP funds, government take-over of banks, autos, now trying for healthcare, and the list goes on. Keep your hands off of our Internet. It runs fine without you and can only be guaranteed to fail once you get involved. First straighten out all the problems with terrorists being able to get on airplanes or bringing firearms onto Forts to kill our soldiers, then address the other issues previously mentioned above. If and when you can demonstrate that you can do something right, maybe the public would be willing to give you a shot at this. But for now, you're just playing politics and trying to punish anyone who actually makes money or believes in freemarket capitalism and you're rewarding all those content to be recipients of social services. Keep it up and enough Americans will revolt and have to dismantle everything that the government puts its dirty hands on.

THE INTERNET SHOULD NOT BE CONTROLLED BY GOVERNEMENT. We do not want net neutrality or the internet as a public utility. I oppose these. If you allow this to happen you will destroy it and so much for freedom and liberty!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

It is not a proper function of the FCC to regulate the internet as it is not a broadcast service, a "public good" such as a radio/TV station and is not necessary to preserving life or safety (such as wire telephone service). It is also not a "natural monopoly" as a regulated telephone service is.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

I want less government interference in markets, the internet and in my life. The Constitution is to restrain the government by providing limited enumerated powers. My elected representatives took an oath to protect and defend the Constitution and I expect them to do a better job, no a stellar job, in that effort. The FCC is likewise on notice. As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

I oppose any and all interference by the FCC regarding the internet in anyway.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an American Citizen, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

We are flawed. Each of us. All of us. That is why we limit the amount of power we give to any group or individual in our government.

You are flawed and do not have the wherewithall to turn the dials behind the curtain to run the internet. Leave it alone. If we need help, we'll give government power to help if necessary. We have not yet granted that power to the FCC or any public servant.

I repeat - YOU ARE FLAWED! Don't be so arrogant as to think that you know best when it comes to the internet.

Additionally, every piece of equipment used to bring the internet to the millions of homes and businesses in this country was purchased by private entities. The government has no business confiscating the equipment belonging to private entities or telling them how they can run their own networks.

To advocate for government control, or regulation of anything in the interest of increasing competition, is laughable. With the exception of the military, the government is not capable of doing anything right. Look at "cash for clunkers" as evidence. The government couldn't run a kool-aid stand properly. I've got a program that the government could apply to almost all situations, and the result would be good for consumers, manufacturers, entities like the internet, people who want jobs, etc., and it would cost the taxpayers nothing. It is called, "THE STAY OUT OF IT ACT OF 2010".

I am submitting the following comment regarding GN Docket No, 09-191, WC Docket No. 07-52:

I am opposed to the concept of "Net Neutrality". Persons and companies that have invested in the infrastructure of the internet should have control of that resource. With all of the methods of accessing the Internet a private company that blocks or censors Internet traffic inappropriately will lose its customers to other suppliers. If government seizes control of the Internet, we will have no alternative if we are dissatisfied with our service. It appears the Commission intends to control traffic in ways it considers "fair". They have no right to do this. Transforming the Internet into a government-controlled public utility is a major policy change and the Commission should not set into motion regulatory changes that will force us down this path. To do so raises constitutional questions of taking of property. The Internet has become a great engine of innovation, growth, and expression. The heavy hand of government must not become its destroyer.

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Keep our Internet free!

Keep America the land of the FREE...not the land of the biggest government in the world.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Huntington Woods, Michigan 48070

I fail to see any good in this proposal. The free market has regulated itself quite well with regards to the internet without interference from government entities. There has been no proof of any kind of discriminatory or anti-competitive behavior, and the idea of content restrictions (paragraph 77 of the NPRM) with the government as arbiter goes against the 1st Amendment.

Indeed, the current administration's labeling of those who disagree with it as "extremists" should be a wake-up call to everyone, for one day those who would stifle free speech with regulations will be on the other side of the table.

This is a really, really bad idea and whoever proposed it needs to be sent packing.

Ronnie Garner

As an American for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent any business model that may be economically more efficient and better. This uncertainty will create litigation and impede investments. Any restriction would inhibit innovation and scare investors such that competition is prevented and rates go higher and particularly for the lowest wage earners in America. Investments and innovation would no longer make economic sense.

Lack of innovation would cripple the internet and then it would have to be “rescued” with taxpayer subsidies. No one wants government control of such a rapidly evolving science because government control always favors the status quo, and this would inevitably lead to politicization and influence by members of congress. Eventually, a “public utility” model would arise as desired by many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

The Commission should not set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have not presented any evidence of discriminatory or anti-competitive behavior and there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of highly effective innovation, growth, and expression that the less regulated, competitive Internet has become.

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The bottom line is that the government should have minimum to no control or regulation of the internet.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

I strenuously object to the FCC's proposed new rules regarding "net neutrality" or the so-called "Open Internet." Government must not takeover the Internet. The Internet must remain under private control and in private hands so that there is true freedom of expression and so that legal free enterprise is unencumbered.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

In order for a society to remain free from government intrusion it must have an unrestricted means to voice it's concerns.

The first amendment of the Constitution provides that means of expression. However, that right can only be exercised if a means for expression exists. The internet, as it exists, provides that means.

A change in the rules governing the internet would dramatically adversely impact on the right of expression that I have guaranteed to me by the Constitution.

I am strongly opposed to any actions taken by members of Congress or the Administration to in any way alter the internet.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I feel the government has enough problems to solve without taking on the internet and a host international companies.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn. I do not want the USA to follow the restrictive examples of China and Iran in controlling the Internet.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an American for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

I would also add that since the internet is used as a form of expression, debate and opinion that it holds the same first amendment rights as news papers, magazines, and TV news broadcasts enjoy. For the FCC, a non legislative office, to force regulations on the internet and people of America who use it without due process is a clear violation of the first amendment of the constitution.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The most important aspect of the internet boils down to one word only: FREEDOM. The idea of "net neutrality" is an insane double standard because on the internet everyone has a voice, and everyone has freedom of speech. If you don't agree with a website, then leave! If an attempt is made to regulate or control the internet, the most important of all American rights, FREEDOM OF SPEECH, will be destroyed! The American people can not, and will not stand for this in my humble opinion.

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Stand with the American people for FREEDOM of SPEECH, not additional government control taking us further and further from the basic ideals upon which this country was founded!

As an American, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

General comment. I am far more worried about the government interfering with Internet access than I am about any private company. Any such attempt by a private company would be met with marketplace restraints and public outrage (probably over the internet!), and would be self regulating. Lawful Internet use is pretty much free from government restriction, and that is the optimum for a democratic society; government control of any media should be restricted to the least amount possible. If problems develop with service providers, THAT is the time to consider rules. I don't think that a "pre-emptive" set of rules is necessary or desirable.

Having said that, here are some suggestions on specific items:

I think that rule 5 should specifically allow service providers to offer different service levels, i.e., access speeds. The language appears to be so broad that it could be construed that providers have to give all users the same speed.

It should be understood and clearly defined that in some cases high bandwidth use by one customer might restrict the access of other users to the internet. That is, someone who is constantly downloading movies or Peer-to-peer content might use up so much bandwidth that other users have degraded capabilities. Thus, the rules should specifically allow the access providers to restrict certain types of activities **ONLY IF THEY ARE ADVERSELY AFFECTING BANDWIDTH**, and **ONLY FOR THE LIMITED TIME REQUIRED FOR NETWORK HEALTH**. The way the proposed rules are written, they may keep companies from protecting the bandwidth of all users.

Rule 6 should have language that protects an access provider from having to disclose to the public any proprietary technology relating to bandwidth and network throughput maintenance. Such technology could be available to the Commission, but a company may have serious investments in technology that should be protected.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

We have the luxury of being able to communicate ideas, knowledge, information and in a country which under its constitution has freedom of speech as it's 1st amendment right. I see that Liberal Facism is alive and well under this administration.

Ours is a government of the people, for the people, and by the people.

I am one of "the people".

The government has no business, no right, to control the internet.

If the government tries to control the internet, there will be more outrage than has been seen thus far.

Many, many people, unfortunately, still believe that this government does not want to control us.

An internet takeover will quickly convince them otherwise.

And people will not be fooled by a "bailout scheme" where the internet is concerned.

You would be wise to make certain that the internet is not controlled by the government.

We, the people, are watching.

In short, Regulators should regulate existing statutes - not create new policy by stretching or making up new rules based on political issues. That last role belongs to Congress. You only implement existing policy.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Free Market system created the wide diversity and explosive growth in the internet. Creation of additional regulations will cause "unintended" consequences which will result in the stagnation of this "American" product/service thereby allowing other countries to leap frog ahead of american innovation and cost U.S. citizens more jobs like those lost due to over regulation of other American industries! Enough is enough!

The Internet is highly competitive. Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

Has the Obama administration ever heard of the First Amendment???? IT'S FREEDOM OF SPEECH. You politicians have turned your job into a gravey train to fill your pockets and take away every freedom this country was founded on, thus insuring your re-election by the lazy who are looking for a "free lunch" and illegal aliens who you are to the leagal voters to where they can vote for you. If you had to depend on Social Security, you'd get it fixed. If you didn't have your insanely ridiculous retirements, which you were able to give yourselves, you'd fix the economy. But where is your money???? Shipped to investments overseas where the rules you cram down our throats don't apply to you. You are nothing but CROOK LAWYERS who are interested in nothing by being re-elected. And I do believe that there should be term limits on every politician.....first term in office, and the second in PRISON!!!

Re: GN Docket No 09-191, WC Docket No, 07-52. I am opposed to a government controlled internet. Today's Internet is highly competitive. Traditional "phone" and "cable" companies struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

In this complex world, I think it unwise to create a situation where difficult internet issues can only be solved with taxpayer subsidies leading to government control and politicization.

Any effort to change the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

Re: GN Docket No, 09-191, WC Docket No. 07-52:

Treating the Internet as a government-controlled public utility is a monumental mistake. Hasn't anyone there picked up on the fact that regulation inhibits progressive creativity, free speech and economic development?

Is it true the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized? Is this not government control of "free speech"?

WAKE UP AMERICA..... HERE GOES ANOTHER OF OUR FREEDOMS. WE MUST STOP THE RUINATION OF OUR COUNTRY BY OBAMA AND HIS GOVERNMENT OWNERSHIP PLANS!

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As a practicing attorney, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is now highly competitive and I use it extensively in my legal practice. There is no abuse that I can discern and in fact it is highly beneficial and very competitive! Traditional "phone" and traditional "cable" companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, it would become slow cumbersome and bureaucratic by definition.

The Internet would then either become crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this archaic "public utility" model is unfortunately the actual desired outcome of many proponents of this regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

thank you for considering my comments, Bob Haas

I believe that the internet market has the power to regulate itself. There are a multiplicity of companies offering internet service. If a private company blocked or censored Internet traffic maliciously it would lose its customers.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Thank you for your consideration of my concerns.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that must be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Sincerely,
Heide Halik

Please refrain from misguidedly imposing regulations that would actually crush competition and remove investment incentive from private providers.

As a concerned American, I am submitting the following comment regarding the matter of preserving the open Internet.

GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously, it would lose its customers.

But if government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership.

Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government.

The Commission should not on its own set into motion regulatory changes that will force us down this path.

That would be a dictatorial restraint without representation that could choke the lifeblood of the free exchange of information, ideas, news, opinions, business, and personal communication throughout this country, causing deprivation of freedoms and financial hardships on business and inventions.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM ...that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted.

In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Bottom Line: Do not impose new regulations that could destroy private investment in the internet, and unlawfully could destroy our freedoms of speech and communication. You are paid with tax dollars to serve - not strangle - the people and communication systems in these United States.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

Let me make my comment simple: The government has no more business determining what content should and should not be carried on the Internet than it does in determining content in a newspaper. Under the guise of such sweet-sounding terms as "neutrality" and "openness," it appears to me that just the opposite is likely to occur if the FCC expands its control over the Internet by assuming or acquiring the power over content that is rightly exercised by Internet service providers. The best way to assure "neutrality" and "openness" on the Internet is to make all legislative and regulatory control over Internet content impermissible.

Thank you for your attention.

Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Government workers are not capable of administering to the needs of the Internet and they can only screw it up.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52: GET OUT OF OUR LIVES !

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. I do not want this taken over by the government! If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn. This is unconstitutional and defeats FREE SPEECH. We must have government get out of communications business--it has no right to be there unless it is specifically authorized for defense purposes--not to censor our citizens and their private business.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be "rescued" with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this "public utility" model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney. These people are not who we need or want in our government..

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized. THIS IS UNFAIR!!!

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become. PLEASE GET GOVERNMENT OUT OF THIS PRIVATE BUSINESS.

Our government seems to have enough problems under the current administration and can't even manage what they have now. Taking a program of Health Care that works for 80% of the population and breaking it to work for 20% of the population. How can they possibly effectively manage more with this kind of shortsighted vision towards socialism?

Get your own house in order and then we can vote(yes, this is America, on whether or not to give the government more power.

Respectfully submitted,

Paul

Any attempt to control the Internet, other than to ban pornography therefrom, is a clear violation of the right to free speech set forth in the First Amendment.

The current proposal for "net neutrality" is simply the thinly-veiled plan of the current White House administration, which is dominated by members of the Democratic party, to revoke the First Amendment rights of those who don't agree with them (i.e., Republicans, Libertarians, and Independents).

The Internet is a fabulous vehicle for information sharing and commerce. Allowing the Federal government to gain any control over it would negatively affect its ability to function as efficiently as it does now. And, any detrimental effects on the Internet will have economic repercussions for our country.

I am all for doing anything to eradicate pornography from the Internet. That seriously needs to be done. However, I do not believe it requires further government control of the Internet to accomplish such an objective.

Please stay out of the Internet. Find another way to infringe on the First Amendment rights of conservatives!

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

As I see it, there are only two things now keeping this nation from complete Socialist/Communist takeover and control:

First is the Second Amendment to the Constitution.

Second is the open use of the Internet.

If those who would deprive the citizens of the United States of the continued implementation of both or either of these entities are successful, the control of the Socialists/Communists will be complete within a very short period of time.

Where do you stand on this?

Corinne Harrup

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. It is my opinion that any action which would limit or control internet usage an development is an illegal use of power by an unelected government bureaucracy. This action should be debated by the people's elected representatives, and ultimately by a full majority of the 50 states.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

The last thing we need is more government regulation.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government.

Also, we see how government control of the internet and communications works in China- a Communist country. I do NOT want government interfering in my right to receive/transmit information via the internet, especially using MY TAX DOLLARS!!!! If you do not like freedom of speech or freedom in general, go to China. I am sure they would appreciate your efforts.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

I think the internet is one of the most positive things to happen recently. People are communicating across boundaries not thought possible 10 years ago. The FCC has enough laws already to enforce. Let the people on the internet regulate themselves what they see.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

Leave the internet alone. It is working quite well without government intervention. No government control is needed or wanted by the users of the internet.

As an Americans for Prosperity activist, I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No. 09-191, WC Docket No. 07-52:

The Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

The envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

For your review I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

I believe the Internet is highly competitive. Traditional “phone” and traditional “cable” companies have been locked in an intense struggle to win customers, and wireless is rapidly becoming another viable alternative to wired broadband connections. If a private company blocked or censored Internet traffic maliciously it would lose its customers. If government exercised control over the Internet, there would be no place to turn.

I think the envisioned burden of proof for requiring network management practices is unreasonably restrictive and will prevent business models that may be economically efficient. This will impose uncertainty and create litigation risks. Such restrictions would lower the rate of return on investments in building network capacity to the point that some of those investments would no longer make economic sense.

The Internet would then either remain crippled or be “rescued” with taxpayer subsidies, which would inevitably bring government control and politicization along with government ownership. Indeed, this “public utility” model is the desired outcome of many proponents of regulation, including former White House adviser Susan Crawford and Free Press founder Robert McChesney.

Such a transformation of the Internet into a government-controlled public utility is a major policy change that should be debated in Congress, the legitimately elected legislative branch of government. The Commission should not on its own set into motion regulatory changes that will force us down this path.

I am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called “net neutrality” have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called “Coalition of Broadband Users and Innovators”) that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

I am submitting the following comment regarding the matter of preserving the open Internet. GN Docket No, 09-191, WC Docket No. 07-52:

Don't interfere wiht the freedom of the internet. Proposals for "net neutrality" or an "open internet" will damage the internet. Hands off please. Keep Washington and its regulations out of our internet. At the very least, this is a matter that should be handled in Congress, not imposed on us by an unrepresentative bureaucracy like the FCC. Thank you.

"I ( am especially concerned that the Commission is already contemplating Internet content restrictions, such as the suggestion under paragraph 77 of the NPRM that the Commission may ultimately be the arbiter of which competing interests should be prioritized.

Advocates of so-called "net neutrality" have been ringing alarm bells now for so many years (starting with the November 19, 2002 letter to the Commission from the so-called "Coalition of Broadband Users and Innovators") that their claims should be heavily discounted. In the absence of concrete evidence of discriminatory or anti-competitive behavior, there is simply no rationale for imposing new regulations that could have the effect of slowing down the great engine of innovation, growth, and expression that the lightly regulated, competitive Internet has become.

"Last, in my opinion (William F Horan) the internet now serves even beyond the important roles of facilitating modern commerce and communications of all kinds both domestic and international. Yes, internet now a key tool & role in citizens defending and protection of our constitutional Republic with a representative democracy.

The agenda before us is rather simple; the internet must remain a tool and even weapon in the citizens Arsenal' in a defense of our Constitutional Republic. Or will the internet be allowed to continue morphing into a weapon for the arsenal of darkness & evil that is a clear and present danger committed to a rapid destruction of our constitutional republic as we know it?

Yes, the Liberty Pole of our founding fathers. The Liberty Pole where the body politic of the peoples government was discussed that ultimately realizes an informed electorate (one of the first defenses of our country and its Constitution and Bill of Rights).

Yes, today our internet is "The electronic Liberty Pole" for citizens of all walks of life across our great nation. Yes, like the liberty pole of every village, town, county, city of our country as it must once again configure for the 21 century challenges and renewal of our country.

The internet is as well a major element in contributing to the required critical scrutiny and subsequent homogenizing of ideas of the body politic as ultimately reflected in a prosperity of our country.

As such the internet now services the role of information transactions and data depository access to our citizens and facilitates the independent exchange of opinion, idea and thought of the citizen (these all elements of adult learning and companion

critical thinking). Such contributes to the core competency and capability of an informed electorate to their active participation in the business of our Constitutional republic.

Accordingly today the internet is a very necessary and critical tool for the individual and collective citizens to exercise due diligence in the protection and defense of their country and its constitution from any and all clear and present dangers.

The internet is a citizen's tool in the duty of performing due diligences in a monitoring and communications of their chosen and elected government officials. Yes, officials with defined - very specific and limited boundaries. Yes, boundaries having been set forth (role and responsibility) to govern a free and independent people (for and by the people)..

Those dangers could range from both domestic and international evil, incompetence, corruption or on occasion even the people's government gone rogue from the boundaries as specified in the US Constitution (will of the people).

As such subjecting the internet to a rogue government no longer subscribing to the constitution and the people's will (or a like private cabol) will enable obstruction. Yes, obstruction in the form of a censorship or interference of any and all kinds and or restricting access, use or content. I maintain that such behaviors for any reason is a violation of freedom of speech & totally unacceptable. I would offer that such a confluence of events as just outlined would constitute a clear and present danger to our Constitutional Republic.

I might observe that today we have already experienced the attack of rogue elements on the internet including; altering scrubbing and even removing information for whatever reason with an avalanche of companion outright propaganda and untruths. The role of Federal Government today and its extent of participation in such and companion less than full application of existing law is very troubling.

I might observe that today we see what appears to be a few cartels (domestic and international) concentrating & controlling news sources and its content to the people via both print and electronic media. Yes, where open and timely flow of contrasting ideas has been severely limited and outright interfered with e.g. de facto censorship and "planting of propaganda memes". As such the internet has become an even much more critical citizens source of information and ideas from any and all vantage points. These components formulate a timely feeding the Arsenal of ideas that ultimately defends our --- freedom liberty and sovereignty of a constitutional republic.

While it is the citizens duty and obligation to sort out the internet or other sources components of wheat from the chafe no one individual, group, or even elements of government has the right to interfere and obstruct this process to the extent we have experienced especially since the 2008 election cycle forward.

The internet is today a critical tool in the arsenal of democracy. Yes, the citizens' first last and ultimate defense of our US Constitution, Bill of Rights & continued freedom liberty and sovereignty of a free and independent people.

I view anything less than a free and open internet as a choice made to utilize the internet as a weapon against this country and its people for the deliberate slide into the abyss of those extremes fostered by both domestic and international evil committed to the destruction of our country as we know it.

Yes, an evil force bent on the destruction of our constitutional republic as we know it and redistribution - plunder of our wealth into the shared misery of socialism.

Such behavior I suggest a manipulation by the dark side evils; including that of a transition of our government and society to a Marxism, fascism and National Socialism.

Yes, all well know dangers to a free people and the American way of life that has secured an abundance to society via independence of thought, idea, opinion, and the individual pursuit of one's agenda and (not a guaranteed -regulated outcome) freedom liberty and a national sovereignty.

The internet must remain a tool and even weapon in the citizens Arsenal' in a defense of our Constitutional Republic? Or will the internet be allowed to continue morphing into a weapon from the arsenal of darkness & evil that is a clear and present danger committed to of a rapid destruction of our constitutional republic as we know it.

The citizens have continued to monitor their government and its transactions impart via the internet. I suggest that today we have concluded that we are already suffering from both domestic and international evils interference in the people's business e.g. the deliberations and transactions of our government.. Yes, an assault on our country and way of life. Today we have a clear and present danger and the citizens are already in the process of addressing this assault on their country and freedom liberty and national sovereignty.

This is nothing more than another " power grab " by Washington, and the people are tired of being told the Government can run thing's better than private company's, what a laugh that is. Stop trying to control every aspect of our live's !!!!
